

## Restoring Files

You can either restore the entire profile or selectively pick the file(s) you want to restore. The client program automatically handles decrypting files if they were backed up using encryption.

### Restoring entire profile

Follow the steps below to restore entire profile

- Select the profile you want to restore. If you do not have the profile on this machine, try creating a new profile with the same name. Profile names are case-sensitive. When a new profile is created, it won't contain any folders on the left hand side. This is okay. Refer to the image below.

- Next, click the **Restore** button
- Syncrify client will first pull the profile from the server matching the name. If it is not able to pull a profile, ensure the profile name is correct.

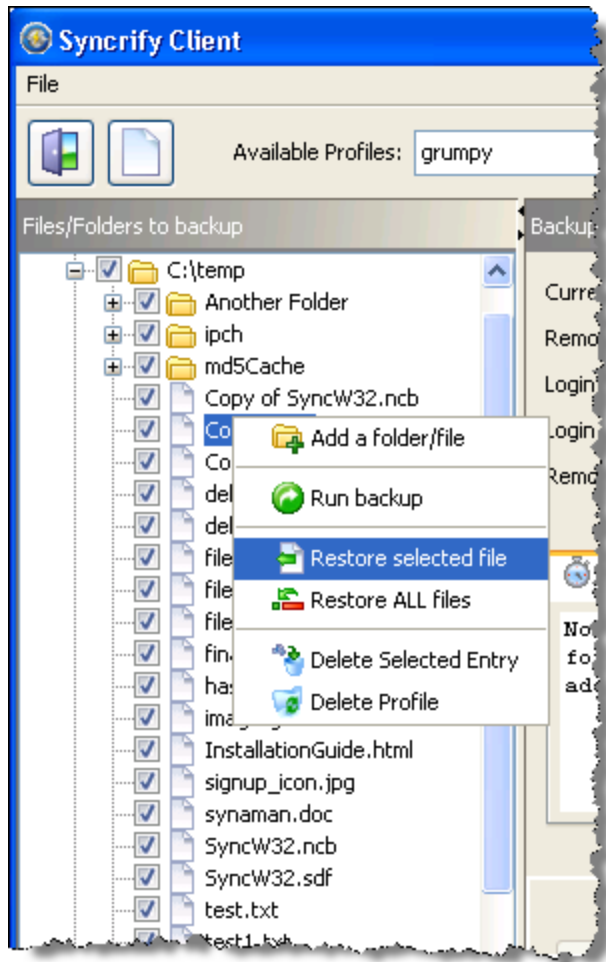

Once the profile is download, it will start restoring the files.

## Restoring selective files

Selective files can only be restored if the profile exist on your machine. Follow the steps below to restore files using Syncrify client

- Chose the appropriate profile from **Available Profile** list on the top
- Navigate to the file you want to restore on the left hand side
- Click the right mouse button and select **Restore selected file**

Refer to the image below.

## Restoring one folder

Version 3.0 uses a concept of **directions** that specify how files are copied. If you change the direction of a profile to **Server to client**, that is equivalent to a restore. Follow the steps below to restore a selected folder.

- Start Syncrify client
- Select a desired profile
- Change the **direction** field to Server to Client
- Navigate to a folder you would like to backup

- Click the right mouse button to bring up a pop-up menu
- Select **Backup selected folder**
